

## Applied Satellite Engineering's (ASE's) ComCenter Approved by Iridium

---

Iridium is pleased to announce that the ComCenter has been approved for commercial sale as of 21 September 2004. The ComCenter is a feature-rich data and voice solution for the Iridium network.

The high-powered intelligent controller and high-visibility display allow for custom configuration to precisely meet the needs of the customer's application.

The analog phone/PBX plug-ins, in connection with the high visibility display, boasts simplified operation, which make it easy for users to set up and troubleshoot - all without dependence on an external handset. The unit also offers an alternative to Crew Calling via the User ID Lock option with call logs of up to 500 entries.

The built in "Smart Dialing" function recognizes country codes, making it easy for a first time user to dial by dismissing the need for the "+" or "00".

Other hardware features include an internal digital ringer, 2.5 mm Audio Jack and Audio compression circuit and a 10-32 V DC power internally regulated.

Finally, in conjunction with remote configuration and management using Ontec Web Services, the ComCenter has the ability to provide unparalleled enterprise-wide communication and data management services, including remote log access and device configuration via the Internet.
