

Applied Satellite Engineering's (ASE's) MariTrack Solution Approved by Iridium

Iridium is pleased to announce that the MariTrack SSAS solution has been approved for commercial sale as of 14 September 2004. The MariTrack combines all of the technology needed for current SSAS compliance and long-range vessel tracking.

The engineers of ASE have researched the trends in the Maritime industry to not only meet the Ship Security Alert System (SSAS) regulations, but to make an end-to-end solution for possible policies to come. A web-based interface provided by Ontec, allows for complete interaction with the ASE MariTrack, giving users global access from a web browser - no software to install - no maintenance. Ontec ensures users secure access using the strongest possible on-line security and encryption.

The MariTrack hardware functionality mimics that of the ComCenter, including the ability to make and log voice calls onboard, an analog phone/PBX interface, crew PIN calling and downloadable crew call logs.
